Rating & Review

Multiple cursor case preserve

Features

Have you ever tried to change a single word in all variable names, but had your camelCase broken? This extension preserves selection case in these situations. It recognises CAPS, Uppercase and lowercase. Works for typing or pasting.

```
var element1, element2, a, b, ElementController;

var element = 3;

const ELEMENT_COUNT = 42;
var $element: any
var $element, listOfElements;

var currentElement = new ElementController;

document.body.innerHTML = '<div class=""></div>'
```

Known Issues

- History for redo breaks when you undo a change made by the extension after pasting into multiple selections. [This issue](#) prevents me from solving undo/redo completely.
- Undo/redo works one change at a time, which for CAPS usually means a **ctrl+z** for every symbol.

Release Notes

1.0.5

Fix a rare exception

1.0.4

More work on undo/redo

1.0.3

Improves undo/redo behavior

1.0.2

Fixes bugs introduced in 1.0.1

1.0.1

Now it doesn't changing anything, if case was equal in the first place - prevents some annoying false positives.

1.0.0

Initial release
